Release PV9.1.0 SV103

This release improves resiliency, calculation accuracy, and visualization behavior in Forecast Value Add, ensuring consistent results across Blueprints, metrics, and views.

Compatibility

Use OneStream Software platform version 9.1.0 or later with this version and Xperiflow version 4.1.0 or later.

Upgrade Information

Upgrading to PV9.1.0 SV103 from any earlier release requires performing an Uninstall Full instead of an Uninstall UI.

New

- Dynamic-dimension resiliency was improved so invalid Blueprints, such as missing source tables, unreachable sources, or schema drift, no longer cause the solution to crash or result in an empty Series Name drop-down on the Views page.
- Source tables that use a date column name other than Date now work when mapped. Views now correctly display data for these Blueprints, which previously appeared to contain no data.

Table of Contents

- Drop from calculation settings are now respected across all configurations and all views. This includes:
 - Cold-start targets where Actuals begin in the middle of a forecast and no Forecast values exist are now handled correctly when applying drop-from-calculation settings.
 - Overhangs of Actuals or Forecasts at the start or end of the selected time window now respect drop-from-calculation settings and display or hide appropriately.
 - Shut-down targets where Forecasts continue after Actuals end are now handled correctly when applying drop-from-calculation settings.
 - Win Margin, DateTime Win Margin, and Raw metric views now correctly respect drop-from-calculation settings.
- When running a visualization for the first time, Forecast Value Add now defaults to selecting the oldest available Forecast Start Date (UD1).
- Source tables containing None as a member in mapped dimension columns no longer cause issues with error metric calculations. Duplicate None members no longer appear in UD dropdowns, and metrics now calculate correctly at all aggregation levels.
- Aggregating Forecast Start Date (UD1) now works as intended. An issue that caused inconsistent error metric calculations when analyzing multiple Forecast Start Dates has been resolved.

Known Issues

- Manually selecting large numbers of elements (approximately 100 or more) in multi-select combo boxes will degrade performance in the Modern Browser Experience (BUX).
- Manually editing the dynamic cube (FVA_Cube) or any dynamic dimension (FVA_[Dimension Type]) will cause the solution to malfunction.

Release PV9.1.0 SV102

This release includes improvements to Forecast Value Add's Blueprint handling, visualization behavior, and data-mapping logic, along with several bug fixes and performance enhancements.

Compatibility

Use OneStream Software platform version 9.1.0 or later with this version and Xperiflow version 4.1.0 or later.

Upgrade Information

Upgrading to PV9.1.0 SV102 from any earlier release requires performing an Uninstall Full instead of an Uninstall UI.

New

- UD1 is exclusively used as the **Forecast Start Date** dimension. All forecast and combined Blueprints must map a DateTime column to UD1, and Actuals Blueprints can no longer map to this dimension.
 - When calculating error metrics and density, the system ignores the UD1 dimension when locating a forecast's corresponding Actuals value.
- Visualizations no longer display incorrect zeros before or after a series' first or last forecast date.

Table of Contents

- Analysis Start and End Time selections apply correctly across all visualization types.
- Blueprints include more robust checks for updates to their source data, and data and metadata update automatically when the source tables change.
- Null values in UDx dimensions are automatically mapped to the None member.

Known Issues

- The current solution is not compatible with BrowserUX.

Release PV9.1.0 SV101

This release includes improvements to Forecast Value Add's Blueprint handling, visualization behavior, and data-mapping logic, along with several bug fixes and performance enhancements.

Compatibility

Use OneStream Software platform version 9.1.0 or later with this version and Xperiflow version 4.1.0 or later.

Upgrade Information

Upgrading to PV9.1.0 SV101 from any earlier release requires performing an Uninstall Full instead of an Uninstall UI.

New

Release PV9.1.0 SV100

This is the initial release of Forecast Value Add.

Compatibility

Use OneStream Software platform version 9.1.0 or later with this version and Xperiflow version 4.1.0 or later.

New

- **Addition of Exclusion Toggle for UD Selections in Visualizations**
 - Added exclusion toggle to help you easily sort through configured dimensions.
- **Performance Improvements**
 - Increased performance across visualizations, especially for large dimensions or large amounts of data.

Known Issues

- The current solution is not compatible with BrowserUX.
- Direct export of SensibleAI Forecast DMF tables that use hierarchical forecasting requires manual intervention to populate unused dimension columns with real values.
